Engin., Trans. 19. pp. 1581-1584, Dec., 1902.)--This is a description of a single-phase, high-tension, alternating current system for operating trunk line railways. A single-phase synchronous motor is carried on the locomotive. This is coupled direct to a continuous current dynamo and exciter. The individual motor armatures on the train are connected to the leads from the continuous-current dynamo, the magnets being all separately excited by the exciter. A field reversing switch is provided in the dynamo field circuit. By manipulating the dynamo field rheostat, the current through the motor armatures necessary to obtain the required tractive effort can be obtained at any desired voltage, from the lowest to the full speed voltage, in either direction. A perfectly smooth and rapid...
